Re: Exhibit demonstrating off the air monitoring of a Winlink email exchange using, in this example, the Pactor mode.

To whom it may concern:

Please find enclosed my first breakthrough in monitoring a Winlink transmission over the air using the following equipment:

- Kenwood TS-480SAT HF Transceiver (set to receive only),
- SCS P4 Dragon DR-7400 DSP Modem,
- Computer with USB port using a terminal program to record the output from the SCS modem to a text file,
- Linux machine with the usual shell tools to parse and process data,
- Compiled executable of the LZHUF encode/decode compression program downloaded from the Github repository.

Summary

After capturing a few days of Pactor/Winlink activity on 3588.5 kHz (dial) USB, I was successful parsing the raw data from the SCS modem into first a binary file then after finding the point where the compressed content of an email message began, trimming the file, and then decompressing/unencoding it using the LZHUF executable program.

The next several pages I step through the various data snapshots of deciphering message two of five I recorded. This document includes the raw data from my entire terminal session with the modem, but due to length is listed in the last appendix. Of the five messages observed, one was ASCII only with the remaining four using compression/encoding at the Application Layer (Winlink). Message 2 was selected and copied to its own file for this demonstration.

Result

While I was not able to get LZHUF to terminate itself with a proper end of file detection, it did successfully unencode several email messages otherwise not viewable from the raw modem data.

Conclusion

Given the steps, meticulous though they are, I performed to achieve this result, the notion Pactor/Winlink transmissions are 100% undecipherable by a third party over the air is false by demonstration. However, there remains the requirement to record every frame and also delete any dupes that may occur from an ARQ repeat request at least for the frames containing the encoded portion of the transmission.

Anyone good at a linux prompt can duplicate my results at leisure. Getting the latest version of beta firmware for the SCS modem will make the job a little bit easier as discussed in the following supporting documentation in the appendices.

Mode Agnostic

Assuming other modes like ARDOP, Winmore, VARA, etc. have monitoring capabilities similar to the handy PMON feature of the SCS modems, one should be able to duplicate these results for Anymode/Winlink.

More work needs to be done. This is only the beginning.

Sincerely,

John S. Huggins, KX4O

Table of Contents

<i>Appendix E – Using LZHUF to decode the email content.....</i>	13
<i>Appendix F – Raw data from the SCS Modem terminal session.</i>	15

Appendix A - Raw modem data for message #2

The text below is recorded from the terminal session tailored from the dialog for the second message observed during this experiment. The SCS modem was placed into a mode called PMON with the default settings save one... PMON HEX. The PMON HEX mode defaults to a method that prints ASCII characters if all the characters are actually printable ASCII in a given frame. If the modem sees an unprintable byte, it presents the entire frame as a comma delimited list of values in two-nibble format. Either way the proper information is made available to the terminal window, but to make things simpler for me, I asked an engineer at SCS if they could add a HEX mode whereby the values are ALWAYS expressed as a comma delimited list of byte values expressed as nibbles. They agreed and within an hour had the new firmware working in my DR-7400. Therefore, the only deviation from PMON defaults was setting PMON HEX to the new value of 2. That is what created the results below in this portion from the larger log of appendix F.

```

Appendix B – Program to parse the binary values from the SCS terminal

The following AWK program helps parse the comma delimited hexdata from the modem terminal capture to a text file with sequential nibbles...

```
BEGIN {  
    skip = 0  
    xcounter = 0  
}  
$0 ~ "^.," {  
    if ( xcounter >= skip ) {  
        framesize = split($0,frame,",")  
        for ( x = 0; x <= framesize ; x++ ) {  
            printf("%s",frame[x])  
        }  
    }  
    xcounter++  
}  
END {  
}
```

Figure 1 - parsedata.awk

A bash script helps to repeat the operation...

```
#!/bin/bash  
cat 2019-07-27_PMON_HEX_02_Msg-005.txt | awk -f parsedata.awk
```

Figure 2 - run.sh

Piping the output through the linux utility **xxd** and then to a file **2019-07-27_PMON_Msg_002_Binary_Raw.bin** results in a pure binary file best viewed with hexdump with the -C option seen on the next page...

```

hexdump -C 2019-07-27_PMON_Msg_002_Binary_Raw.bin

Appendix C – Retrieving the compressed email body from the file

The next task is to retrieve the part of the file containing the actual email message after the communication headers. I wasn't sure where this portion begins, but guessed it was just after the visible ASCII portion. After pulling several portions of this file with different start points and running LZHUF on the result, messages popped out when 02 FA started the file (highlighted in the previous listing) just after the ASCII section. Using linux command line tools I parsed the file to this resulting binary file...

```

Appendix D – Compile your very own copy of LZHUF

The source code lzhuf.c is found in many places. Here is one spot...

<https://github.com/tyll/tinyos-2.x-contrib/blob/master/eon/eon/src/util/lzss-c/lzhuf.c>

Compile a standalone executable with this command...

```
gcc -DMAIN -DENCODE -DDECODE -DVERBOSE lzhuf.c -o lzhuf
```

Appendix E – Using LZHUF to decode the email content

Running 2019-07-27_PMON_Msg_002_Binary_Trimmed.bin through LZHUF gives this output...

...and the file goes on and on revealing the nature of LZHUF to never really quit unless it sees a proper termination. I had to kill the program. How this termination works is still to be learned.

I probably need to trim some trailing bytes to fix this, but the larger point is this message...

----- Message from KW4SHP sent 2019/07/28

... popped out of the encoded portion of the Winlink message as seen by a third party monitoring system without use of any Winlink software.

Obviously more work needs to be done to make this easier for future band watching systems, but the point is proven that it is possible.

Appendix F – Raw data from the SCS Modem terminal session.

You will see a few times I typed in a frequency in kHz at the modem's prompt causing an error message from the modem. These were merely meant to document changes to the VFO frequency in the log file.
